

# Minister Sees End to U.S. IT Purchases

By [The Moscow Times](#)

March 26, 2014

A Russian minister said U.S. spying could harm U.S. software companies such as Microsoft.

U.S spying could cost software companies said Communications and Mass Media Minister Nikolai Nikiforov, in a message attached to an Instagram shot of a recent Wall Street Journal article detailing renewed U.S interest in spying on Russia.

"U.S. security services have put an end to the further use of U.S. computer software and hardware in Russian government and related sectors," Nikiforov wrote Monday, Vedomosti reported.

The U.S has gained a reputation for extensive electronic surveillance of foreign countries. On Wednesday Brazil's lower house of Congress voted in favor of a law that would make it harder for the U.S. National Security Agency to secretly mine Brazilian web data, following revelations that the agency hacked into a number of world leaders' private email accounts and monitored their telephone calls.

U.S spy agencies are now seeking to improve their surveillance of Russia, after failing

to predict Russia's blistering fast takeover of Ukrainian peninsula of Crimea, The Wall Street Journal reported Monday. "It was classic \*\*\*maskirovka\*\*\*," a senior U.S official said, using the Russian term for camouflage to describe the stealth Russian forces used to evade U.S intelligence.

U.S. and European software manufacturers have been experiencing success in Russia recent years. Microsoft started operations here immediately after the Soviet Union's breakup, and now has an installed base of over 10,000 companies across the country. German software maker SAP has been working in Russia since 1992 and has offices in multiple Russian cities. SAP's revenue in the post-Soviet sphere rose in 2013 by more than 20 percent, Reuters reported March 13.

SAP Russia declined to comment on how a government ban on foreign software might affect their business, but said that they would wait "and see how events develop." Microsoft Russia also declined to comment.

Industry players said that although there is local computer hardware assembly, the government may have a harder time divesting itself of foreign software technology. In the meantime, the Federal Security Service has taken some old-fashioned steps to reduce its high-tech vulnerability. In February 2012, the successor to the KGB and Russia's main counter-intelligence agency purchased more than 100 typewriters for 2 million rubles (\$62,000).
