

Sochi Ski Resort Construction Threatens Clean Water Supply

July 14, 2017

The expansion of ski resorts near Sochi has increased the danger of landslides and could cut off clean water to 100,000 people, according to a new World Wildlife Fund report published on Friday.

Construction on Sochi's ski resorts began in 2006 ahead of the 2014 Winter Olympic Games and has continued since.

Ski resorts there are expanding even three years after the international sporting event as a result of increased tourism to the area.

In March 2017, Prime Minister Dmitry Medvedev allowed areas of the Sochi Reserve and the Sochi National Park — home to numerous, unique animals and plants — to be rented for 49 years to companies connected to the local Rosa Khutor resort.

"Unfortunately, we don't have any information on what goals they have and what they plan

to do on these territories," Valery Shmunk, director of the WWF Russia's Caucasus division, told The Moscow Times. "This is a big problem."

Between 2006 and 2017 the areas of Sochi's National Park, the Sochi Reserve and the Caucasus Reserve under development nearly tripled.

Some of the newly let land is upstream from the Mzymta River. Environmentalists warn that building resorts in these areas will increase the risk of landslides and destructive floods.

Construction could worsen the quality of water in the Mzymta River, which is the main water source for more than 100,000 people living in the Adler area, the WWF report says.

From 2010 to 2013, landslides size ranged from 5,000 to 20,000 cubic meters. In May 2017, a landslide with an area of roughly 3 hectares descended on the Gorki Gorod ski resort course, the <u>Izvestiya</u> newspaper reported.

Despite the threats to the environment and water supply, Sochi residents are largely unmoved by the recent developments.

"Unfortunately, the majority of people are quite passive," Shmunk said.

This comes down to the lack of public information about the construction plans and their environmental impact, he added.

"The materials that are brought to public meetings leave much to be desired," Shmunk said. "You can feel a definite haste in the way the materials were prepared. Some of the statistics don't correlate with each other."
