The head of the Russian cyber-security company Kaspersky Lab has said he will testify before the U.S. House of Representatives, a day after government agencies were ordered to stop using the firm's products.

The U.S. government has been given one month to map their use of Kaspersky products and three months to begin their removal, the U.S. Homeland Security Department (DHS) [said](#) in an online statement on Wednesday.

Last July, the Trump administration already removed Kaspersky from the list of approved state agencies' software vendors, [citing](#) concerns Russian authorities could infiltrate U.S. government networks using Kaspersky's anti-virus products.

The Reuters news agency [cited](#) the U.S. House Committee on Science, Space and Technology as saying on Thursday that it had invited Eugene Kaspersky to testify on Sept. 27. alongside an unspecified number of U.S. government and private sector cyber experts.

Kaspersky, who founded the company in 1997, has denied having ties to Russian security and intelligence agencies since suspicions [surfaced](#) in 2015. But he has acknowledged he graduated from a KGB-sponsored school and worked for the Soviet Defense Ministry.

Kaspersky said he had repeatedly offered to testify before the U.S. Congress to address any questions about his firm.

“I have accepted an invitation to testify before US House of Representatives & address allegations about KL [Kaspersky Lab],” Kaspersky wrote on Twitter late on Thursday. “Hope to get expedited visa.”

He added in an opinion piece published by Forbes that he is willing to provide the company's source code for an official audit.

Kaspersky [cited](#) “geopolitical turbulence” as the likely reason why U.S. Homeland Security banned his company's products from federal IT systems.

“As I've said before, it's not popular to be Russian right now in some countries, but we cannot change our roots, and frankly, having these roots does not make us guilty.”

The United States' largest electronic retailer Best Buy announced earlier this month plans to stop selling Kaspersky Lab's products at its stores.
