At least 800 British and U.S. customers of the Uber ride-hailing service have reportedly been billed for phantom rides in Moscow and St. Petersburg.

Uber [admitted](#) this week that the personal information of 57 million users and 600 drivers worldwide was stolen last year. The tech company paid a \$100,000 ransom to delete the data and cover up the breach.

More than 800 customers in the U.S. and Britain have complained to Uber that they were billed in rubles for rides in Russia's two biggest cities, The Times [reported](#) on Thursday.

Disgruntled British customers have shared screenshots on Twitter of billing information in rubles for supposed trips in Moscow and St. Petersburg. Users also said their phone numbers had been changed to Russian numbers.

The Times said Russian cyber-criminals are suspected of being behind the breach.

Ironically, if the hackers behind the breach are Russian, Uber customers based within Russia are unlikely to be affected by the global data breach, The Bell outlet [writes](#). Cyber-criminals in Russia face severe punishment if caught at home but they are rarely extradited abroad, the report said.
