

Moscow Tests Anti-Missile Shield with Rocket Launch

February 12, 2018

Russian Ministry of Defense

The Russian military has successfully tested an upgraded anti-missile shield at a time of mutual mistrust between Russia and the United States over missile defense.

Russia's Aerospace Forces <u>tested</u> the interceptor missile twice last year at the same site in Kazakhstan, following the activation of a new NATO missile defence station in Romania. The Western military alliance's defense system has raised Moscow's ire over what it <u>views</u> as an arms buildup along its borders.

The latest missile "successfully completed its task, hitting the target at the scheduled time," Russia's Defense Ministry <u>cited</u> Colonel Andrei Prikhodko, deputy commander of the Aerospace Forces air defense command, as saying in an online statement on Monday.

Media outlets <u>said</u> last year that the tested Russian missiles were an upgraded version of the 53T6 Gazelle short-range missile interceptors.

The Russian ministry said Monday that the shield was designed to intercept missiles targeting Moscow and to serve as a missile attack warning system.
