

# Russia Claims Europe's First Exoskeleton-Assisted Surgery

March 12, 2019

**ExoChair / [karfidovlab.com](http://karfidovlab.com)**

Doctors at a hospital in southern Russia have conducted what they say is Europe's first surgery with the help of exoskeletons, the state-run lender Sberbank announced on Monday.

ExoChair, [developed](#) with help from Sberbank's robotics division, is [designed](#) to support the lower limbs and pelvic region to help reduce fatigue and improve efficiency among workers who stand for prolonged periods of time.

The exoskeleton was used by doctors during a 12-hour urological surgery at the Second Regional Clinical Hospital in Russia's southern city of Rostov-on-Don, the hospital [said](#).

"This is the first experience of using exoskeletons in Russia and Europe to support surgeons, and we consider it to be successful," Stanislav Kuznetsov, the vice president of Sberbank, [said](#) in a statement.

He said that the ExoChair's lower price gave it an advantage over its closest competitor in

Japan.

In Monday's press release, the bank said the "passive industrial exoskeleton" was initially intended for Sberbank employees before its designers recognized its wider applications.

Sberbank said it took the doctors' advice into account as it plans to improve the device's usability.
