

Automation May Push 20M Russians Into Unemployment, Study Says

September 10, 2019

Sergei Kiselyov / Moskva News Agency

More than 20 million Russians risk losing their jobs to automation over the next decade if they don't develop new skills, according to new research.

Economists estimate that robots will take over more than 20 million manufacturing jobs worldwide by 2030. Automation is expected to lead to major job losses despite bringing in increased productivity and economic growth.

Almost half of the Russian workforce, or 20.1 million people, risk losing their jobs to digitization and automation by 2030, research by the Russian Presidential Academy of National Economy and Public Administration (RANEPA) [says](#).

Workers in industries including hotels and restaurants (73%), manufacturing (60%) and

agriculture (58%) are most at risk of being replaced by automation, the study says. Other affected industries will include transportation and warehousing (57%), retail trade (53%) and mining (51%).

The authors of the study note that the projection is based on a hypothetical scenario in which automation technologies are implemented instantaneously.

In practice, this process will be drawn out, allowing some workers to retrain or find new jobs.

“There’s still a chance to retrain [and] change your functions,” the research’s author, Stepan Zemtsov, was quoted as saying, noting that the effects of robotization will be “stretched out in time.”

Meanwhile, the authors warn that many of those at risk will be unable to keep up with the technological change.

“Part of the population won’t be able to... retrain, learn new technologies, constantly compete with robots and continuously learn,” Zemtsov [told](#) the Izvestia newspaper.

The phenomenon of lost jobs will come to be known as an “economy of ignorance,” he added.

Correction: The headline and text of this article have been changed to reflect that the projections of the study are based on a hypothetical scenario in which automation technologies are implemented instantaneously.
