

Russian Energy Giants Suffer Under Anti-Coal Campaigns

In the absence of a government drive to reduce the use of coal, Russian companies are becoming targets of divestment campaigns from international investors.

Foreign investors are set to turn away from Russian energy giants as green investment strategies gain traction, according to market analysts.

Russian bank VTB Capital said on Friday that a number of energy-generating companies, including subsidiaries of Gazprom and other state-owned entities are “uninvestable” for some European funds “which have adopted a coal divestiture policy.”

The move away from coal has become mainstream policy in the United States, the European Union and China, where governments, companies and investors are trying to reduce the share of the dirtiest fossil fuels in their energy mixes.

Conversely, the Russian Energy Ministry has forecast an increase in coal consumption over the next three years. Russia is the world's fourth-largest user of coal, behind China, India, and the U.S.

"Investors have already started to act," VTB said in its report on the Russian utilities sector. Analysts "note that 100% of Swedish and Finnish investors, and a growing share of German and Baltic investors calculate coal's contribution to the [earnings] of utility companies and have either already approved, or soon will, targets to divest from companies in which the share of coal exceeds certain limits."

Those limits typically prohibit funds from investing in companies where anywhere between 10-50% of earnings come from coal-fired power plants.

More than one-third of earnings at Gazprom subsidiary OGC2 and Unipro are earned from the generation of energy through coal, VTB found. Generating giant InterRao — owned by Rosneft and other state entities — also makes one-fifth of its cash from coal activities. Even the world's second largest renewable energy producer Rushydro is exposed to divestment campaigns, VTB said.

In response to the push from investors, "some [companies] choose to divest ... others choose to ignore the issue," the report said. Enel Russia, a subsidiary of an Italian state energy company which was the largest polluting energy producer in Russia sold its coal-fired power plants earlier this month, in a move which analysts said would please green-minded investors.

Meanwhile, the contribution of coal to the earnings of Unipro is set to balloon to 59%, making the firm untouchable for any investment funds with even the most forgiving of coal quotas.

Gazprom has tried to get rid of its coal power plants which it says are unprofitable, but potential sales have been blocked by the Russian government due to their strategic importance.

In the short-term, VTB does not expect divestment campaigns to have a significant impact on energy companies' share prices. However, if the firms do not divest, increasing numbers of European and U.S. investment funds will either have to sell their holdings or will not be able to buy shares in the first place. This places a cap on international demand, meaning the shareholder base would become less international and the companies would struggle to capitalise on future strong performance.
