

Russian Girl Discovers 40,000-Year-Old Lemming From Ice Age

December 27, 2019

nplus1.ru

Russian paleontologists have published their findings on an ancient mummified lemming that was found by a schoolgirl in Siberia, the N+1 science news website [reported](#) Thursday.

The lemming was found intact in an elongated position with a preserved skeleton as well as fur on the back, sides and stomach, as seen in photos from an [article](#) published earlier this year by the Russian Academy of Sciences. The frozen carcass was first discovered by a schoolgirl in Siberia's Yakutia region in 2016, before being taken by a group of researchers for study.

Scientists estimate that the mummified rodent is more than 40,000 years old and dates back to the Ice Age — making it the oldest known lemming that has ever been discovered.

While animal remains decompose in Siberia's permafrost slowly, discoveries of their mummified remains are quite rare, the scientists wrote.

However, it is not the first mummified animal to be discovered in Siberia in recent years.
