Russia's ambitious plans to build 25 waste-burning power plants risk provoking social unrest over their environmental and financial costs, Greenpeace Russia [warned](#) Thursday.

State industrial conglomerate Rostec, state nuclear agency Rosatom and the VEB state development corporation on Thursday [announced](#) a 600 billion ruble (\$7.6 billion) project to build the 25 waste-to-energy plants in "Russia's largest tourist centers."

Greenpeace warned that the public could end up paying for the plants' construction at least in part while also facing higher energy costs as consumers. Together with five others scheduled to launch in late 2022 outside Moscow and in central Russia's republic of Tatarstan, Greenpeace estimates the plants will spew 5 million metric tons of toxic waste every year.

“Local residents will go on strike,” the environmental NGO said in a statement. “They don’t want to risk the health of their children, who will have to breathe the harmful emissions.”

Greenpeace also warned that the plants will increase Russia’s dependency on plastic and delay its move toward reusable materials.

Environmental activists previously criticized Moscow city authorities’ plans to [equate waste incineration with recycling](#) in their trash reform plan for the next decade.

Rostec [disputed](#) Greenpeace’s assessment, calling its technology “the most widespread and well-researched in the world [and] the most ecologically clean and safe for the environment and the population.”

“Myths about the dangers of waste-to-energy plants apply to older-generation plants,” Interfax quoted Rostec’s press service as saying Thursday.

The backlash toward the waste-incineration plants is the latest issue in Russia’s [struggle](#) to reform its waste management system. Russians across the country have [rallied](#) since fall 2018 against Moscow’s plans to export its waste to more remote and less populated regions.

This story was updated at 1:04 p.m. on May 18 to clarify Greenpeace’s warning that waste-to-power plants could delay Russia’s move toward reusable materials, not biodegradable materials.
