

Argentina, Mexico Face Second-Dose Shortages of Russia's Sputnik V Vaccine – Reports

June 21, 2021

Argentina is reportedly in “intense talks” with Russia as many first-dose Sputnik V recipients have had to wait up to 12 weeks for the second shot. **Zoltan Mathe / AP / TASS**

Argentina and Mexico are facing a shortage of second doses of Russia's Sputnik V coronavirus vaccine despite Moscow's pledge to supply 10% of the world's population, according to several media outlets.

Argentina's La Nacion daily [reported](#) Sunday that its government is in “intense talks” with Russia on new deliveries because many first-dose recipients between late March and early April have had to wait up to 12 weeks for the second component.

Citing official data, it said that Argentina received 7.8 million first doses and only 1.5 million second doses of Sputnik V by mid-June.

Bloomberg [reported](#) Saturday that less than one-fifth of Argentinians have received both shots of Sputnik V, a subject that opposition lawmakers raised with the Latin American country's health minister.

It also reported that Mexico complained in May that production delays are leading to a shortage of Sputnik V's second component.

Russia has delivered 17 million of the promised 896 million doses to other countries, compared with China's 234 million and India's 76 million, according to Bloomberg's calculations.

The Russian Direct Investment Fund (RDIF), which markets Sputnik V worldwide, says it is on track to produce 1.6 billion doses in 2021 through agreements with 25 manufacturing facilities in 14 countries.

Peer-reviewed research published early this year said that Sputnik V is 91.6% effective. Argentina and Mexico were among the earliest countries to approve and receive shipments of Sputnik V this winter.

Experts [say](#) Sputnik V, despite the lack of research, also appears to be effective against the more-contagious Delta strain that is driving Russia's third wave of the pandemic and straining its health care system.

Russia last month [registered](#) a single-dose version of Sputnik V, called Sputnik Light, which the RDIF said has 79.4% efficacy.
