

1 in 4 Russian WWII Vets Died During Pandemic – Vedomosti

November 22, 2021

Russia's World War II veteran population fell from 1.21 million last year to 896,800 this year. **Mikhail Tereshchenko / Moskva News Agency**

One-quarter of Russia's World War II veterans have died during the pandemic, according to an analysis by the Vedomosti business daily [published](#) Monday.

Some 312,600 veterans of what Russia calls the Great Patriotic War have died between April 2020 and October 2021, Vedomosti reported, citing Labor Ministry data.

Russia's total [excess fatality](#) count since the start of the coronavirus pandemic — and before the latest and deadliest wave of the virus — is at least 723,000.

The rapidly accelerating decline of Russia's World War II veteran population from 1.21 million last year to 896,800 this year, amounts to a 26% decrease.

Among Russians 85 and over, mortality rates have increased from 165 per 1,000 in 2019 to 190 per 1,000 in 2020 — and are likely to reach 209 per 1,000 this year, Vedomosti cited demographer Alexei Raksha as saying.

Experts attribute the veterans' disproportionately high death rate to them being at higher risk of developing serious illness from coronavirus. The Russian Association of Gerontologists and Geriatricians places the likelihood of adverse reactions to vaccines across all age groups at 2%, and higher among the elderly.

Authorities say Russians aged 60 and over are at least [5.5 times](#) more likely to be hospitalized with Covid-19 and account for 83% of the country's total pandemic death toll.

Only around one-third of Russian retirees have received a Covid-19 vaccine despite efforts to [incentivize](#) vaccinations with cash handouts and other gifts.

Elderly Russians “are at a loss and don’t know whether to vaccinate or not, for fear of side effects,” Valery Ryazansky, the chairman of Russia’s Pensioners Union, told Vedomosti. He called for increased efforts in providing consulting services to seniors as well as wider research and testing of the vaccine's effects on this age group.

“Someone who is over 85 years old needs to be thoroughly examined prior to vaccinating them,” added Vladimir Chekhonin, the vice president of Russia’s Academy of Sciences.
