

# Wildfire Smog Blankets Moscow Amid Heatwave

August 18, 2022

Smog in Moscow. **Sophia Sandurskaya / Moskva News Agency**

Moscow has been blanketed by wildfire smog coming from a nearby region fueled by a summer heat wave, Interfax [reported](#).

Authorities in the Russian capital [advised](#) residents on Thursday to wear face masks to protect themselves from the smog.

The Federal Forestry Agency (Rosleskhoz) [blamed](#) authorities in the Ryazan region, where the wildfires are currently burning, for failing to keep the fires under control.

Several aircraft and over 470 people were working to put out the fires in the Ryazan region some 250 kilometers southeast of Moscow, the emergencies ministry [said](#) on Telegram.

The region's Governor Pavel Malkov estimated Wednesday that over 800 hectares had been affected by the fires, which officials later [said](#) were caused by dry thunderstorms.

International environmental group Greenpeace however [put](#) the size at over 3,300 hectares.

Moscow Mayor Sergei Sobyenin [said](#) Thursday that forest fires have also hit the nearby Vladimir region.

Emergency Situations Minister Alexander Kurenkov on Thursday [urged](#) local authorities across central and western Russia to ban people from visiting forests.

"There is a high probability that the fires were caused by human action. And the persistent heat and drought are creating favorable conditions for the fire to spread," Greenpeace's Russian chapter said Wednesday.

The NGO said that these forest and peat fires were burning through an area that was already affected by the fires of 2010, which caused weeks of suffocating smog in Moscow at the time and led to thousands of deaths across western Russia.

Massive fires have swept through Russia's vast territory in recent years, particularly impacting Siberia, the Arctic and the Far East.

The blazes, which are increasingly frequent, are exacerbated by low rainfall and heat waves that scientists have linked to climate change.

Each summer, these fires release huge plumes of noxious smoke that suffocate towns and cities as far as hundreds kilometers away.

In July 2010, Moscow was suffocated by smoke from peat bog fires resulting in an unprecedented spike in respiratory health complaints and deaths.
