The swelling Tom River in southwestern Siberia has led to a partial dam collapse in the city of Tomsk, authorities <u>said</u> Monday.

"The water has partially destroyed the protective dam," Tomsk Mayor Dmitry Makhinya said in a video posted on social media that shows him surveying the damage.

Spring flooding caused by melting ice is a regular occurrence in some parts of Russia, but this year's heavy rainfall, combined with abnormally warm spring weather, has led to severe flooding in Russia's Urals and western Siberia.

So far, the floods have <u>submerged</u> around 15,600 homes and 28,000 land plots in 193 Russian towns and cities across 33 regions, state-run media reported on Monday. Almost 200 houses near Tomsk were under water as of Monday morning and 84 people were evacuated.

The Tom River, which stretches 827 kilometers, could reach a dangerous height of 8.9 meters between Monday and Wednesday, the Tomsk regional government <u>said</u>. Emergency officials have carried out <u>ice blasting</u> — a process by which explosives are used to break up ice — in the Tom River over the weekend to prevent flooding caused by ice jams.

Mayor Makhinya criticized Tomsk residents who were seen gathering at the city's damaged embankment to watch the annual ice drift.

"Think about your safety, don't go to the dam now, don't hang down from the bridge parapet in pursuit of good shots," he wrote on the Russian social network VKontakte. "Disaster is not entertainment!"

Meanwhile, almost 13,000 people have been <u>evacuated</u> from the Kurgan region near Kazakhstan in anticipation of flooding there, the governor's office told the state-run news agency TASS on Monday.

Kurgan region Governor Vadim Shumkov <u>said</u> a "colossal" amount of water was headed toward the region's capital city.

The Kremlin said emergency officials expect floodwater levels to increase in the Kurgan and the neighboring Tyumen regions by mid-week.

Russian Emergency Situations Minister Alexander Kurenkov on Monday <u>arrived</u> in the city of Orsk, the original epicenter of flooding in the Orenburg region, where water levels peaked over the weekend and are expected to recede early this week.
