More than 150 beaches along Russia's southern Black Sea coast remain unsuitable for summer vacations due to ongoing contamination from a recent oil spill, the head of Russia's consumer safety watchdog [said](#) Friday.

Oil slicks continue to be [detected](#) off the coast of Anapa, a popular resort town in the Krasnodar region, nearly four months after two aging Russian tankers were damaged in a powerful storm. The vessels released thousands of tons of heavy fuel oil into the sea, sparking an environmental crisis that has since cast serious doubt over the upcoming tourist season.

"The Temryuksky district and the coastal areas of Anapa don't meet the requirements for organizing summer resort holidays," Rospotrebnadzor chief Anna Popova told reporters, according to the Interfax news agency.

“At present, 141 beaches in Anapa and nine beaches in Temryuk have failed to meet pollution, sanitary and hygiene standards and cannot be used for health and recreational purposes.”

The Temryuksky district lies just east of the Kerch Strait and borders annexed Crimea, another popular summer destination. Emergency workers have been [deployed](#) across affected areas to contain the spill and clean up contaminated coastlines, including beaches on the annexed Crimean peninsula.

Despite the pollution, Russian authorities have continued to organize spring and summer trips to the affected areas for groups, including children with disabilities, raising safety concerns.

In January, a 17-year-old university student [died](#) in Anapa after he was reportedly exposed to toxic fumes during volunteer efforts to clean up the oil spill.

Still, on Friday, Popova [offered](#) a more optimistic assessment of the situation in Crimea and its port city of Sevastopol.

“More than 6,000 samples tested... have shown no violations of hygienic norms,” she said, crediting rapid cleanup work for the relatively safe conditions. In contrast, over 60,000 samples were analyzed in the more severely affected Anapsky and Temryuksky districts.

Popova noted that while “small spills” continue to be observed along the coast, they are being localized and contained swiftly. They “don’t affect the overall condition of the coastline,” she said.

The spill and slow cleanup effort have already caused a [steep drop](#) in tourist demand for Anapa, threatening local economies that rely heavily on seasonal visitors. Last month, the government environmental watchdog Rosprirodnadzor said the oil spill had caused an estimated 84.9 billion rubles (\$1 billion) in environmental damage.

The companies that own the two oil tankers involved in the disaster [face multiple lawsuits](#) from regional prosecutors, the Russian Maritime Rescue Service and the city of Anapa, which in March [said](#) that it had spent 211 million rubles (\$2.4 million) on beach cleanup since the Dec. 15 spill.

According to an investigation by transportation authorities, the ships were not supposed to sail in the open sea during winter, as they were designed mainly for river navigation and calm coastal areas.
